Has anyone figured out how to "un-train" a spam filter when it becomes too strict? Mine now catches all email from a certain project, despite the fact that the sender is in the address book and junk mail controls are set to exclude any email from senders that are.

I gave up on useless filters so now pay a small amount each month for spam filtering at my ISP. Have not seen a single item of spam in 15 months.
So perfect, I'm now suspecting that each email is manually read before forwarding!.

I'll look into that but could only do it if they send the spam marked for an automatic path to the waste basket. I need to be able to look because there will be the occasional miscatch.
