My HD has 4 partitions, three OSES, and 5 logical drives; part #1=C: bootable Win98SE, part #2=D: and E: extended DOS, part #3=F: bootable DOS, part #4=G: bootable Win2K.

I have used GhostPE to copy this working drive to a backup HD for quite a while with rare problems.

But now, every time i do this, i get the message "NTFS Error: Could not read used MFT REcord – run CHKDSK" right before it does the copy.

I have carefully run Defrag and (Win2K's) CHKDSK on all drives and then tried the copy; same crap.

How the &&#\$ can this be fixed?

Google mft error – bunch of hits, don't know if they will help.

Ed

I put on my hip boots and waded thru some of the hits, and ther is no clue as to what was meant or the consequences of an unreadable "used" MFT record.

About the only thing was mention of a "change record table", which might record changes in an MFT – and if so, that might be a way of discovering if an MFT record had been "used" in the sense of "changed".

Thanks; i think i will just ignore the stupid error message.
