Oh sorry, I guess my wording was misleading. Yes it is a servo motor driver that is intended to drive an RC servo motor, but instead, it is driving my circuit. There is no servo motor.

Well that doesn't sound too bad. RC servo is something like a one millisecond pulse (if my memory is working) that is pulse position modulated. 0-4.5 or 5 volt pulse. That shouldn't be a problem and I wouldn't think 6" of wire would be either.

If you have a scope, look at the signal on the 10X probe range. And look at the output (drain) too for ringing.
