Once upon a time my PSpice symbol library had a strip-line model from my days designing chips for the Garmin GPS units.

Garmin actually designed their own chips once?

I talked to Garmin at a recruiting show back around 2003 and at least the group I talked with said they were now using off-the-shelf GPS receiver modules, such as the popular SiRF units. I ended up with the impression that these days they were mainly system-level designers and programmers.
