Anyone know of a cheap passive infrared webcam? Even an OEM module or something. Not the kind that need LEDs but the kind that see temp.

I'd like to play around with monitoring my reptiles at night, see what they're doing, and what sort of body temp they're getting to....

Normal webcams go somewhat into infrared if you remove the filter. Maybe not low enough for a reptiles body temperature, but you can allways light them with some IR LEDs (B.t.w. do they see short wave IR?)

Or something with a Nipkow disk and the sensor from a PIR motion sensor??
