Nah, it's mutual. I don't like to keep stuff either, there has got to be a solution. In fact, I'd like to reduce the office footprint here at some point and keeping the old box goes in the wrong direction. When googling I found that this is by far not the only mobo that has been lobotomized down to one floppy drive. Only a matter of time until that number becomes zero (AFAICT it has on some).

Some of the cheap Dell home PCs are shipped without a floppy drive, and the motherboard didn't have a connector, or the controller chip installed.
