If I had to dodge etching, I'd rather use adhesive copper tape than conductive ink.

OK, where can I get some? McMaster-Carr, Digi-key, and Mouser all have it as narrow as 1/4" - I'd need something more like .06 (1/16) or so.

Or do you buy the wide stuff and slit it? =:-O

Man, I miss the days when you could walk into the hobbyist store and buy anything you could think of.

Thanks,
Rich

I got stuck too with the same problem..
I ended up doing time consuming trimming.
I bought a nice roll of copper tape from a glass artwork shop for \$4.00..
