hi,my name is wes4723 and i will like to discuss science well i would like to one day be apart of the NASA program or be the scientetist to be the one to design the new model shuttles for more or extra oxygen while on the venture of traveling to mars and maybe be the one on that exact shuttle. What do you think ?

1st major project should be asteroid defense.

2nd major project is the earth evacuation to mars in case project 1 flops so bad that earth conditions are worse than mars.

3rd major project...make damn sure that space/time isn't hackable.

This universe sucks for travel without FTL.

At present, space travel tech is like worse than riding horses... it's slow and crappy!

Even light speed is crap compared to how everything is spaced apart...
