Somehow I'm missing the beginning of this thread, but...

For day-to-day use I started with an HP-32S II, then went to the 33s, and now the 35s... although I've been trying to get around to changing over to an HP 50g given the bugs present in the 35s. (I used an HP-48SX and then GX throughput college to very good effect, and while the 50g is not exactly the same level of quality that those machines were, it does have all their capabilities and more).

For Phil Hobbs: PPC is still alive and well (<http://www.hpcc.org/>). Jake Schwarz scanned in a bunch of the back issues of their newsletter, "Datafile" and sells copies on CD here: <http://www.pahhc.org/ppccdrom.htm> . Any chance you were the author of some of those old articles?
