How are flat spiral (pancake) coils wound? How does the machine differ from a conventional computer controlled winding machine?

Isn't it just the degenerate case of 1 turn per layer?

But the ridiculous aspect ratio (height of turns : width of turns way way bigger than one) will require some sort of bobbin wall.

I don't know much about "conventional computer controlled winding machines" but have run hand-driven Morris coil winders.

Tim.

do they dance with swords?

Cheers
Terry
