I'm looking for a product – similar to the semi-custom transistor arrays Cherry Semiconductor (now ON) or GEC/Plessey used to have back in the early 90's: an array with hundreds of transistors, with some larger devices around the periphery. They had some cross-unders and some resistors too. I'd prefer to customize only one metal layer. I have some past experience with the old Cherry product. I plan on providing the layout but will consider outsourcing layout to the vendor. Vendor must be capable of packaging and testing. My specs:
Process: bipolar or CMOS

1 GHz ft if Bipolar

<= 0.5 u if CMOS

350 transistors

process voltage >= 5 volts

Thanks, Frank
