Hi

I'm considering to purchase a pc based logic analyzer. After a bit of shopping around I narrowed down my options to either the Logicport from Intronix or the Annie-USB from Janatek, maybe even their Logic-16 as well.

Before I make the final decision, is there anyone of you that owns any of these instruments?

The obvious reason for the logicport is the fact that it costs only U \$389 for 32 channels and 500Mhz sampling rate. I have however read this little faq article on janatek's website on how to evaluate(compare) between various logic analyzers and I'm having doubts of buying a logicport. The Annie-USB although a tad more expensive seems to be a really good quality instrument. Any of you having thoughts on this.

Luckily the need is not pressing so I have a couple of days.

Most of these PC based instruments are very poor to start with, after a few years they become unsupported and if you break them in the bin they go. You would do much better looking on ebay for an Agilent or Tek instrument for less money.
