Hi all,

I have an array of N switches . Initially all are OFF.

Somebody turns them ON in some order. It is possible that more switches are turned ON in the same moment.

I need a device which shows me the order in which the switches were turned ON. For instance the device should give me: 4,3,1,5,2 (this is the order in which the switches were turned ON).

The way in which the output is shown is not important. It must be simple to read (by a human, computer, etc).

It is important that the device is able to handle the turned ON (in the same moment) of the multiple switches.

thanks,
Laura
