In article <09WdnUGuTdyAkMTVRVn_vwA@xxxxxxxxxxxx>, me@xxxxxxxxxxxx says...

The Flavored Coffee Guy wrote:

I just finished building a K9A2 Platinum Motherboard, AMD Phenome 64 bit Quad Core, 4Gig RAM, multi-card reader, video capture card, video card, 1Gig of Ram and DirectX 10.1, SATA Hard Drive, with a Creative Labs Sound Blaster X-Fi Xtreme Fatality Platinum Sound Card, and it works. All I have left to buy is the speakers for the 7.1 surround sound.

I don't have a motor case, and I will be looking into magnetic simulation software soon. All of it will work, it's just that either you have no experience or education in the field, or are not applying and assuming that you will be proven right in the end without working out a single equation relying on a guy who wrote what is considered a law of thermodynamics, that really doesn't have more to support it than the Big Bang, or what really happens at the bottom of black hole.

When are you going to stop talking about it and actually build and run the Over Unity Motor? You could have bult it in less time than you spent building the PC described above.

Less talk, more action, please.

If he would just harness all that hot air he blows, he could run a small village.
