Well I spent a half hour of my life under the magnet of an "open" MRI machine yesterday. Still a bit claustrophobic. While I sort of understand the theory of the MRI, what I don't understand is what creates all the noise and racket. Any experts out there that can tell

me

whats going on?

Pulsed gradient coils. These are "small" 3-axis coils that sweep a gradient field across your innards, modulating the nuclear resonant frequencies of your molecules to produce the spatial resolution. These are generally water-cooled, with ballpark 20 KW constant-current drivers per axis, playing all sorts of weird waveforms.

They scanned my head last year, with the gradient coils around my head

Re: MRI Machines

like some horror mask: noisy and boring.

John

A few years ago they scanned my sinuses.

I must admit a claustrophobic feeling also :-(

That's probably because you guys don't have a house with a narrow crawl space. At least you can be sure that there won't be critters such as rattle snakes waiting inside that MRI tube.

<http://www.analogconsultants.com/>

I had a rattle snake in my garage a couple of weeks ago.
