I am on an energy efficiency drive,,,and have an issue with windows being left open and heating being left on by employees in 4 buildings. Despite constant reminders, this still keeps happening so id like a electronic solution thus... a sensor on all upstairs windows that open, and if more than a quarter on an inch open, the sensor will send out a wireless signal to a receiver near the boiler to turn it off. I was thinking of using a wireless door bell as a prototype.

Any suggestions?

Lock the windows and have only one key, which the boss controls.

Also, put thermostats in the rooms, to let the occupants turn the heat down!

Good Luck!

Rich
