That boils down to about the same effort as a complete re-install onto a new HD, plus Linux is quite nerdy, requires you to know the magic command line Swahili with which I am not familiar.

Bulloney. Linux distros support archival retrieval, and copying that volume to another will yield a perfect, functional, bootable copy. No re-installs required, no magic words. Linux installations are typically image copies for most applets and applications that get installed. Not much gets compiled during the installation runtime.
