On a sunny day (Thu, 18 Jun 2009 11:39:00 -0700) it happened Joerg <invalid@xxxxxxxxxxxxxxxx> wrote in <79vfukF1s8uarU2@xxxxxxxxxxxxxxxx>:

Yeah, it can be similar with WLAN. I often get five bars (full strenght on the crude RSSI thingie in the laptop) in the living quarters of the house here. But that's the signal from a cordless phone, if that doesn't transmit it's between zero and one bar and very iffy :-(

I do not get it, here I still have to see the first dropped packet with WiFi. Linksys WAPs are good. Microwave on or not, GSM on or not, dunno about wireless phones. On the Sweex USB WiFi adapter I had before that, there was constant link loss..

But I have a free standing house, maybe that makes some difference.

Well, American house are a bit larger :-)

Plus ours has aluminum backed fiber insultation in inside walls. Guess the builders wanted to be extra good.
