I just went for a walk and found a discarded computer system. The computer case had been broken open and little was left unscavenged. In addition to the computer and monitor, there was a HP LaserJet 4, and I decided to give the printer a home. It has no cables and I have no idea at the moment whether it works. Unlike the hp 4110 all-in-one, the HP LaserJet 4 **is** known to printtool on my RH 7.1 Linux PC. So, trying to get it to work is a possibility, if I can get the cables and maybe replacement cartridges or whatever, which might add up to a significant amount of capital that I'd rather spend on other things, especially since I don't know if the thing works in the first place. Better to stick to looking for stepper motors and other useful subsystems.

What cables? My HP LaserJet 4 uses a standard Centronics interface, and a common IEC power cord so I have over a hundred of each on hand. These old printers are workhorses, but you don't want to leave them on all the time. I have a half dozen laser printers that I haven't even fired up, and won't, till I run out of toner on the pair of old IBM 4019 printers that I'm using.
