Do they amke any kind of AC adapter that will let you use something like a car stereo or a CB radio in the house?

I remember years ago you needed a regulated power-pack kinda thing to do this but I was wondering if that's still the case today? Like maybe some kind of AC adapter that will let you run something that normally runs of 12 volts DC neg. ground.

Thanks

Leesa (I)

I know I'm probably going to get flamed over this one, but a car battery charger works well most of the time. Just make sure you get positive and negative correct. The only problems I have ever run into is the radio picking up noise from the charger.
