My Sony GDM20SE2T takes 15 minutes or more for the display to come on. After reading multiple items on this newsgroup and across the web, it sounds like I have a capacitor that needs replacing. I have found one that shows 200megOhm resistance and steadily goes down when I test it with a DMM. It is a 220?F 400V cap so I would imagine it shouldn't read like this. Am I on the right track, and if so...where would be the best place to get a replacement for it and any others I find that are trashed?

Thanks,
Charley
