Hi!

Thank you for providing the great tip on the AV-716. The display on my unit died in February 2004, but the amp itself worked fine until today (November 2004). When switching the unit on, there was only one click (it use to be two) and no sound or display.

R921 and R922 on my unit was busted, and both the display and the amp seems to work fine after replacing them.

I want to replace all the resistors you mentioned. However, I seem to have a different value for R924. Mine is 8.2 ohms (gray/red/gold) while yours is 33 ohms. I have removed it from the PCB and checked with a multimeter (~8.5 ohms) which seems to match the color coding.

Do you know if it is possible that I have a different PCB version? Mine has the code "NCAR-4692" on it. The amp was bought in Norway sometime in the 90's (I bought the amp second hand in ~1995 I believe). Can you confirm that your R924 (sitting next to R923) is 33 ohms?

I would like to apologize in advance for any misconceptions or mistakes on my part. :-)

Thanks in advance,

Oivind H. Danielsen
