Hi all,

Looking at this monitor and when power is applied, the green power led lights and then turns amber and flashes at 0.5 sec intervals. No HV crackle or static on screen, no heater glow, etc. I have used an iso-xformer to check some voltages and the B+ (180vdc) supply comes up and then slowly goes bleeds off. Any known common failures that I can check? No obvious burned components and all fusible resistors test ok.

Thanks for any info...

Kirk S.

P.S. I'm not feeling very confident with Sony products...
