I have a 21" Sony monitor and about 7 thin diagonal lines have appeared on my screen. They look like faint aperture grille lines, but are angled upward starting at the bottom left. It gives the monitor a "Candy-Cane" appearance. They do not go away when the monitor is disconnected from the computer, or with degaussing.

Any ideas of what has gone bad?

Approximate cost range to repair this?

I've spent quite a bit of time searching for clues to this problem so any input would be greatly appreciated.
