On this side of the pond "many millions" is not even close to 330 million +.

True, but think about the enormous length of the electricity network in the US and Canada compared to the UK. The UK (and that part of Europe that the UK could possible support) would easily fit about 10 times in Ontario alone....

Just out of curiosity: How many Megawatts of electricity is the UK capable of exporting before its own network collapses?

Do Little2
