Hello,

We have this cordless phone we purchased a while back and some folks complain that if they talk for a long amount of time, the handset gets a bit warm and affects their head, etc.

The phone doesn't have a built-in speaker capability.

I was wondering if I could attach a speakerphone to this phone and then have the others stay a bit away from the handset. Is this possible?

Also, is there much emf being emitted from cordless units?

let me know if it's possible...

.
