Sam,

On page 4 of the English schematics I sent you which details the timer sequence, at the bottom left, there are some faded word that says 1T/60 sec, i.e. 1 turn/min. Would that answer your question in regards to whether the cam moves in 1 minute increments?

Furthermore, I think that each square there represents 5 minutes. If I added up all the squares for the first program which includes the pre-wash, it'll amount to 135 minutes which is very close to the user manual that indicates 2 hours 35 minutes, considering the water-fill time, repeated rinse and drain. I assume the 135 minutes would be the actual drum-turning time.
