Hi:

My Sony TV model KV-27-FV300 has developed an issue recently.

Video input from any source (VCR/DVD/Satellite box/Cable box) makes the picture grainy and images are doubled slightly. I'm not seeing the picture quality that this model usually delivers. I switch on the TV and change the channel to "Video 1". I press "Display" on the remote so that the channel label displays on the screen. The moment I connect the yellow video cable to the output of any source, the "Video 1" shows as double and the picture quality comes up as grainy. I've tried channel 3 with a co-axial cable but with the same result.

I have also tried to connect another TV and the picture is perfect, i.e. no double images or ghosting.

This problem developed overnight, one night it was OK and the next morning, the TV came up like this.

Any ideas?

Thanks in advance,

AJ.
