Hello-

I'm not sure if this is the right forum for this question, but here goes.

I am putting together a stereo cabinet and I would like to mount the control panel for the receiver (buttons, knobs etc.) in a location that is slightly separated from where the receiver case itself would sit. Here are my questions:

-Is this possible? My thought is that the control panel probably has wires running to electronics in the case of the receiver. If I could just extend those wires, then I could mount the panel elsewhere on the cabinet.

-Is there any recommended type/brand/model of receiver that would make this particularly easy to do? I haven't chosen the receiver I will use yet. I have pretty limited requirements feature-wise (radio, cd input, aux input, A/B speaker channels), so if there is a new or old-ish receiver I should consider please let me know.

I appreciate any help,  
afinpx
