These are not standard jacks that you will find at most parts suppliers. You would have to find a way to substitute them.

The other alternative to have the computer properly serviced, is to let the factory rep service it. They have access to the original parts, under agreement with the manufacture of the computer.

In many cases, they change the complete board to service any component problems on the board.

Hi,

The audio jack in my laptop (a sony vaio z1) died and I would like to replace it. I checked the digikey catalog but could not determine whether they have a compatible model.

I thought maybe if I provided some pictures, someone could help me identify its type.

Pictures are here: <http://www.lri.fr/~ig/connector> . The faulty jack is the green one.

On the first two pictures, I've taken the little removable plastic ring off the jack's head.

I presume there are four pins, but can't be sure, since it sits on the mainboard which is quite a pain to dismantle.

Thanks
