You might try a mast mounted amp. The old adage "you don't pull the signal, you push it" should hold true. Since it is unlikely the you can run power up there, you need a coax powered unit. Many of them are. As far as I know there are no real requirements for an ATSC amp, other than to amplify 50-900 Mhz. If Terk doesn't have one maybe try Channel Master.

Even if you took your present amp and determined the internal DC requirement you could send the DC through the coax. You shouldn't even have to build anything, between power pass and power block coax filters you should have no problem setting it up.
