I recently acquired a Sun GDM-90w10 (rebadged Sony w900) 24" widescreen crt. It is very old (manufactured Dec '97), but it was in remarkably good condition and worked beautifully.

Tonight I returned home and switched it on, to find that while it made the clicking noises that it usually makes as it starts up, it didn't come on. Instead of the tube powering up with the typical "bong" noise, it made an extra click noise, and the green light switched off, to be replaced by the light next to it blinking orange. This LED has a symbol that appears to be a crossed out lightbulb.

When I bought the monitor, there were no manuals for it, and the best I could find on the internet was a <a href="http://www.sunshack.org/data/sh/2.0/infoserver.central/data/syshbk/Devices/Monitor/Msheet/a"><http://www.sunshack.org/data/sh/2.0/infoserver.central/data/syshbk/Devices/Monitor/Msheet/a>>, so I have been unable to find what this flashing LED means.

I do not believe that there should be anything physically broken in the monitor, as (to my knowledge) it hasn't been moved since I used it last week, but I can't be sure.

Re: Is my monitor really broken?

Did my monitor just meet it's inevitable end and wear out?  
Can anyone  
help? Is all hope lost?

Try unplugging it for ten minutes, then try again.

If it still doesn't work try it on a different computer and see what happens.

Do you hear it crackle when it powers up, will static cling make paper stick to the screen, if not did it used to?

-Landon

The monitor crackles normally, but it doesn't seem to make any static. It sounds like it tries to turn on, but a breaker/relay clicks at the last minute.

do the bulb test and post results. have you measured any of the power supply lines? you'll have to give us a few more indications if you expect useful suggestions
