More recent models had a microprocessor to handle control and setup, and some Sony Trinitron monitors, including Dell badged ones, featured "digital color return technology" which was intended to enable a return to original factory-shipped color temperature and luminance if desired at any point over the lifetime of the monitor.

I've fixed many monitors like this. It works very well on most monitors that have the feature. There are a few 21" monitors where it doesn't appear to do anything at all (all of them made from about 2001-2002).
