I need the high voltage board, part #awv1383. I had a technician look at my t.v. and he said I needed the high voltage board. I have checked with pioneer and they are selling the board for \$500.00 dollars. Wow expensive!!! Maybe somebody has a t.v. they are parting out. Thanks.

What's wrong with the HV board? I've fixed a couple of these, one had lots of cracked solder joints, another had a shorted transistor in the

HV regulator which was causing the voltage to shoot up and trip the protection.

The tech came and looked at my t.v. He tried to resolder but it did not work. Then he told me that its common for this type of board to go bad.

Must not be a very good tech, there's not really anything irreplaceable on that board.
