I think your computer is set to a scan speed that the monitor doesn't support very well. The monitor apparently can produce a picture, but doesn't recognize it as valid input -- except during the moments when the computer is turning on and goes into plain VGA mode for a moment.

Right-click on your Windows desktop, go to Properties, Settings, Advanced, Monitor, and change the refresh rate.

Hmm... it is the other way around. After I wait a second and connect, then monitor comes on and is able to display at higher refresh rates. I believe I was running it at 1400x1050 at 70Hz and it runs fine at that refresh rate. It doesn't work if it is connected right from the beginning

Also, resolutions supported by this monitor:

1024 x 768
1152 x 870
1280 x 1024
1600 x 1200
1792 x 1344
1800 x 1440
1856 x 1392
1920 x 1440

No where in that list do I see 1400x1050. Again, set to a resolution that the monitor supports and it probably will work properly.
