Just upgraded from an old analog tv to a Samsung DTV. The first problem I noticed is the lip sync audio-to-video time delay on NBC's national digital programs. While analog broadcast has some small time delay, digital has 2x-3x more delay, making it almost impossible to watch. Local station in-house digital programming does not have any more delay than analog, but as soon as they switch to national programming, the delay goes to hell. ABC & CBS does not have nearly the delay that NBC has. I brought the problem to the attention of the local NBC station, but they said & did nothing. Does anyone else notice the problem, or is it generated by my local station?

KC

You didnt mention what your A/V setup is, but what source are you using for your video/audio?
