I took a look at the part numbers here. These sound like proprietary numbers. The manufacture services these by board exchange. They don't service these at the component level.

If you call in for a board, I think they will not sell to you directly. They will tell you to bring or send the monitor to one of the factory authorized service reps.

This flatscreen model GWT-P42M303 shorted the 15v and I isolated it to
pn 4921QP1002B. There are two of these driver hybrid thingees and one
is shorted but finding parts seems to be a problem. Any ideas?
