I am looking for manufacturer of good power supplies, preferably a US-based company.

I bought a Chinese Mastech 30v 10a CVCC power supply. It was cheap, and upon arrival I see why. I'm new to this stuff and the manual is pretty useless.

I would like to find a similar HP, Tektronix, or other high quality comparable type power supply, so I can try to find/buy/download a manual for one. I bet an HP manual would clear up how to use these things.

Thanks a lot.

A power supply is a power supply. The cheapest one will do. I have good luck with \$18.00 power supplies. They either work or they don't. People who pay \$150 or \$200 for a power supply are crazy. I've bought the cheapest for decades. It don't have to last 200 years, I won't live that long and it will be obsolete in a couple years anyway.
