We've been using some off-the-shelf LCD HDTVs in a 3D vision system. The system relies on being able to flip (mirror image) the picture on one of the monitors.

The feature was built in to the TVs we were using, but those models have been discontinued, and we're having trouble sourcing this feature elsewhere.

Any educated guesses on how difficult it would be to add the feature ourselves? If it matters, we're talking about a vertical flip, not horizontal.

Most LCD projectors that I am aware of are capable of doing this. Maybe you can use one of those or a CRT.

Thanks, we actually started with the projector concept, three years ago, but the customer opted for monitors... CRT's are too bulky.
