Does anyone know where to get a water flow meter that will close or open a switch when water is flowing? I have an AC unit that uses water to cool itself and it produces 110 deg water if you reduce the flow enough. I'm trying to build a setup that will switch between the on demand hot water heater and the AC unit for the house. The major difficulty is determining if there is water flow to the hot water lines in the hosue..

Thanks,

Mike
