China also has a proposal to develop 2500MW of Hydro power in  
Labrador–Eastern Canada

so what are they going to do with electrical power in Canada?

they can't ship it to China,

Actually, it is possible.

The losses are quite high – 50% or more.

But, with sufficiently cheap electricity, it can be made to work.

IIRC, this is the case in Norway, H<sub>2</sub> from electrolysis is now cheaper  
than imported gas.

H<sub>2</sub> can be tankered around the planet, it's just annoyingly undense.

.
