GreenFuel Technologies Corporation has been doing this now for a few years. They are able to decrease pollution from power plants (over 40% CO2 reduction and over 80% NOx reduction) using an algae bioreactor. The best part about all this is that these algae that feasting off these pollutants can be converted into biofuel. Its a win win situation

where pollution is reduced profitably.

Check it out for yourself: <http://www.greenfuelonline.com>

They also have a cool search engine powered by Google that searches global warming issues and technologies that can be found here:
