I hope
you're
right..

So, think for yourself. What
of the economic impact?

Sigh... There's no pleasing some people.
economies routinely
survive realignments as big as this one.

Please provide just one example.

How will the world's central banks increase money supplies
in the face
of diminishing resources?

The switch from a horse based economy to a gasoline based economy
comes to mind.

New cheap energy is not an example of 'adverse impact'.

The current switch from local production to international
production of trade goods also seems relevant.

Re: The INEVITABLE H2–PV Economy in 41 years. Unstoppable.

New cheap labor is not an example of 'adverse impact'.

what makes you say that the resources will be diminishing?

<http://oilcrisis.com/http://theoildrum.com/>

You have a startlingly one track mind, or perhaps none. In addition, seem utterly unable to comprehend that change != adverse impact. Regardless of oil production, energy production will continue to increase, so where's the problem? this isn't a question of diminishing resources it's a question of a resource shift, in which most likely, the resources currently provided by liquid fuels will be taken up by grid power, for a net increase in available total energy resources.
