Thank you for confirming the impression I have gotten from your posts in other threads: you're a loony. Simple hand waving is **not** engineering, and any mention of storage needs to address retrieval. It is particularly amusing that you explicitly mention no less than **two** electricity-based storage systems when attempting to take a stance against electric busses.

What the puck is "simple hand waving" about storing/taking energy to/from flywheels, or that of utilizing h2o2/aluminum batteries,

Neither are practical.

or for
that matter via simply and rather squeaky clean combustion in a duel fuel injected engine that'll knock your socks off at hardly any SO_x or CO₂, and absolute zilch worth of NO_x?

How about a link to this marvellous engine ? I think you're making it up.

Graham
