Look. People are lauding him and I just asked them to point to his seminal papers. If you make the argument that he is great, then you are claiming something very rare in the history of mankind. It is up to you to back up your claims. Trying to make others show he is not great does not prove your point.

Sure, I agree (and I have not made any claims so far), but I really wondered whether you thought that he has contributed no seminal papers at all. (Perhaps this relates to the meaning of "seminal", really).

What about the 1968 SIAM Review (with Van Ness) on "Fractional Brownian motions, fractional noises and applications".
