

Re: NASA Worldwind, & Large scale features in Africa

` a large one. "Synclinal" is just descriptive isn't it, or does  
` it enfold an implied mechanism?  
  
` \*(how is that possible? why not, people are fans of lots of things; I live  
` in BC, where geology is everywhere, and on the coast I see the boundary  
` between the cordilleran basolith and the vancouver island sediments, where  
` for instance a granite headland can be seen on a gulf island beach pushed  
` up against a black marble formation, peppered with quarter-sized white  
` ammonites, in layers which have been compressed in a series of loops like  
` ribbons in a fancy gift bow. Stunning.)

`` I'm trying to remember the addresses for some sites giving quick  
`` overviews of the resource potential of different countries, because  
`` something of this scale would certainly be considered a likely target  
`` for oil exploration (kitchen area in the centre, centrifugal migration;  
`` stratigraphy exposed around the margins, plenty of potential for  
`` faulted traps). On the other hand, since I've 3 friends working in  
`` Lybia at the moment, maybe I'll just ask them when they get back. They  
`` might be mud men, but they do have some idea about geography.

``
