Come of it, Gerald. Stuart's not a doctor, I wouldn't let him near me if he was. ...he's a Big Dakine (check your dictionary, but as usual he can't spell. Or maybe he is and it's the dictionary that can't, .. that's dropped the 'e'). Big Dakins claim authority by dint of the lint they cover up, and the prose of the nose they exude. You don't think for a minute he believes in convection cells do you? He's only intent on cover-up, dropping names and telling people he can read books and fill his head up with stuff. Which is convenient, because it saves the need for space to think about things. Wonkernoddly say Stuart is a great thingkuh, though he purports to know stuff. I'll bet he knows enough numbers to be able to answer that question in the image you put to him about convection cells – that one with slabs of crust that look like the Titanic going down. The only question is whether he can get them in the right order.

.
