I have repeatedly demonstrated this.

There are no observations which require the earth to expand, that are not already adequately explained by PT.

(OK folks, ...let's try him with this one.)

Stuart

With India 'colliding' / 'docking' with Asia to give the Himalayas, how does Plate Tectonics explain the extensional basin of the Takla Makan/Tarim behind them? And the big swivel of the Mongolia – Kamchatka – Lena River behind them too?

You were big some time ago on the Himalayas as evidence for Plate Tectonics. What's happened to you? Gopher it, Big Boy.

Hi. I've seen so often threads on expanding earth, and I do not have the geological skills to judge that. However, I've heard/read that for instance, the warming of climate would make the oceans expand just by thermal dilatation.

So I guess if oceans can expand then the core and crusts can expand too.

Has this expansion been measured in some way ?

I mean : measuring an expansion that can be explained by thermodynamics might be as interesting as measuring an expansion that only astrophysics can explain.
