It is not an ad hominem to question reason. Have to think this is a defensive response rather than you thinking it was an attack on you, since find your idea intriguing.

I believe in the idea that given two competing theories of what moves continents, and which one of them easily builds a model (the top of a refrigerator vibrating) and the other never has a model (tanks which try to build 6 convection cells and molasses but too sticky), that no-one should accept Convection Heat simply because of the Logic--

If you cannot build a working Model of a proposed theory, then the science community should never take the theory ever serious. Even a junior-high-school kid can understand this.

So what, in your mind, does the Convection heat theory explain why Pacific Ocean is 1/2 and the continents the other 1/2.

It does not. It does not explain the pattern on the ocean floor, which shows a mechanism which is controlled by a unifying force, rather than what would be expected from individual convection cells,

Re: never able to build a model for Convection heat theory means the theory is a fake

Re: never able to build a model for Convection heat theory means the theory is a fake  
controlled by heat alone.

Six pots on the refrigerator top representing North and South America, Europe and Africa, and Asia and Australia can be vibrated by the motor below to end up in the pattern of ||| which exists today.

So, the Refrigerator Top Model can duplicate everything that is now seen in Continental Drift. I can even duplicate seafloor spreading and your ocean floor. I remove the solid steel top of the refrigerator and replace with numerous strips. What happens is the vibration separates the strips in the center and causes them to drift to the edge. The strips do not migrate to the edge as fast as the pots, but nonetheless, it mimics seafloor spreading.

Why is South American moving slowly yet Australia moving fast?

Heat and convection are contributing factors. They just are not the only things in play. Both matter and energy, external to the system are likely being added. The real question, does the pattern on the ocean floor show a closed system, or open?

The only Model that works so far is the refrigerator top, and apparently heat is not involved in the vibration motion. So heat and convection have no models. This tells a rational person that since the only model that works is Vibration due to electromagnetism of the Asthenosphere to Lithosphere boundary, that we never consider heat and convection for they have no role in how plate tectonics works.

If one model-- refrigerator top with vibrations explains it all with no role for heat and convection. Then it is time to ditch this lousy and fake theory.

It is obvious that the Asthenosphere is rather closed to the Lithosphere except for the occasional volcanic activity that brings magma to the surface.

Electromagnetism Vibrations at the Asthenosphere boundary is a CLOSED system. And works better when it is closed since it makes the boundary that much more uniformly different from the Lithosphere. So that the Asthenosphere becomes more Iron rich and the Lithosphere more aluminum rich and the Vibration is more effective.

Re: never able to build a model for Convection heat theory means the theory is a fake

The reason my refrigerator works better than the Asthenosphere is because the plate top is solid steel and my pots are solid metal also and the vibrations thus are more effective in moving.

If the system were open then the boundary would be continually diluted and polluted of different chemistry whereas if it is closed it becomes more pure in metal differential between the 2 layers and thus more effective in electromagnetism vibration.

If closed, all the energy to drive it must have been contained within it from the beginning.

Yes, that is what the Motor Vibration theory would confirm. Except for the occasional interruption of volcanic magma deep within Earth, this boundary between Asthenosphere and Lithosphere has been very much the same since the birth of this planet. And all the electromagnetic forces due to Earth Core as Motor and due to Lightning Bolt strikes have concentrated their energy in the form of Vibrations at this boundary and explains all of Continental Drift and Plate Tectonics.

(snip)

Sorry had to snip this science fiction for it makes J. Taylor look bad.

Which then causes two questions, rate and frequency.

In the Vibration theory, the continents and ocean are in cycles where they come together as a Gondwana whole such as the Pacific Ocean and then cycle back out into a ||| pattern. So they drift into a ||| pattern for a billion years and then into a O pattern where they come together as one big continent and then a billion years later into another ||| cycle. The geological record has evidence of this cycling pattern.

Re: never able to build a model for Convection heat theory means the theory is a fake

Irrelevant at the moment.

What is the Convection heat theory model? Have they ever written about their model?

No, but there is evidence for it, it just is not the only evidence.

Some say that MIT has a molasses tank

Some say that Cal Tech has a tank that feature convection cells as conveyor belts.

The entire trouble with present day geophysics is that they all believe in the Convection heat theory for only one reason— they can get a huge number for a source of energy. But they could never build a Model that in any way mimics how continents actually move.

I can build a model and every household in the world that owns a refrigerator has a model of how continents move.

Geophysicists for the past 50 years have made a laughing stock of themselves, by violating a basic principle of science. If you cannot build a working model of a phenomenon, then you have no theory or explanation of that phenomenon.

You probably cannot answer a single one of them.

Did answer, just not definitively. There is vastly more taking place than what Plate Tectonics explains.

JT

Well, no. There is a wrong explanation in the form of Convection Heat as to what is really going on.

The Convection Heat theorists deny that Lightning bolts contribute to the motion of continents. They deny that Earth Core produces electricity and which translates into vibration that moves continents.

Re: never able to build a model for Convection heat theory means the theory is a fake

So the science of Geophysics has been wrong for over 50 years as to plate tectonics.

Even a High School kid can understand that if the Asthenosphere is a solid as well as the Lithosphere that motion between these two layers takes place not by heat differential but by vibration forces.

You certainly have an imaginative way of thinking. Do not suppose it will do any good to point out some of the more obvious flaws, like your pots can bounce into a new location on the refrigerator's surface because nothing else occupies the location.
