Hi.

For all those who support the crazy "Earth Expansion" theories, tell me this: Where. Does. The. Extra. Mass. Come. From?

In order for the theory to work the mass would have to emerge from the CENTER of the earth. What do you propose is down there, anyway? Some sort of "white hole" (reverse of a black hole)? If so why does it pump out rock instead of hydrogen or other stellar materials like is common in space where black holes usually sit?

Snowballs arrivng from outer space.
